

Test it fairly

Name: _____

Date: _____ Period: _____

Change speed OR strip width. Keep the light, sensor height, start and white paper the same.

A successful test

- ☐ Three approach runs stop when red is read.
- ☐ Red and unknown both end the test; white cannot restart it.
- ☐ The program ends after no more than 20 checks.

Record every result

Run	Saw red?	Distance past line (cm)	Stayed stopped?
1			
2			
3			

- ☐ Wheels raised: red and other/unknown readings stop it. Showing white again does not restart this test.

Change one thing. Try again.

The one thing we changed:

We kept these things the same:

Run	Saw red?	Distance past line (cm)	Stayed stopped?
1			
2			
3			

What could make the robot miss a narrow red strip?

Use a result: our change helped / did not help because...

Before leaving: save your code, stop and power off the robot, return parts, and hand in this module.
